

Division of Oral and Maxillofacial Radiology
Department of Human Biology and Pathophysiology

Outline

Oral and Maxillofacial Radiology consists of radiation physics, radiation biology, radiation protection, the principle of medical imaging, and clinical imaging diagnosis. The study of Oral and Maxillofacial Radiology includes the improvement of imaging diagnosis, and quantitative analysis by the image processing for the oral and maxillofacial lesion. The themes of our research are shown below.

Faculty members

Professor; Eiji NAKAYAMA, D.D.S., Ph.D.

Assistant professor/full-time lecturer; Atsutoshi NAKATANI, D.D.S., Ph.D.

Assistant professor/research associate; Kazutaka SUGIURA, D.D.S.

Clinical instructor; Masayasu TASHIRO, D.D.S.

Postgraduate students; At the present time, non

Main research in progress

- 1) Image findings analysis of the disease and study on Interventional Radiology in the oral and maxillofacial region
- 2) Research on the free radical development from the irradiated contrast media, and the radioprotection effect of anti-HBs against the free radical development from the irradiated contrast media.
- 3) Study on effective dose evaluation of dental cone beam CT
- 4) Study on the influences of the photo-induced discharge against the diagnosability of intraoral radiology using the imaging plate
